

Date: 8/21/19

Meeting: Council Technical / Security Committee Web Conference

Topic: Review of new technology applications

Two new technologies were reviewed with the Council Technical / Security Committees' to seek input for their technical and security expertise.

1 ) Introduced the capability for Text to 911 call data to flow via ethernet into the PSAP's call logging system. The committee discuss the type of firewalling and security elements that would need to be put in place to ensure that there was no concern for harm to be introduced into the Vesta Call Handling system. The committee made suggestions to the AT&T/Motorola design that would be incorporated into the deployment plan.

2) Introduction of Vesta Map Locate replacement with a "Rapid Deploy" (RD) map system. The capabilities of the RD platform were discussed with the committee as well as the network architecture. RD had a network security expert on the call to explain how their product was compliant with industry standards and how they maintained system security integrity. The committee reviewed the design/architecture and determined that the design was sound and a solid approach for the map replacement.
